Introduction. In a DC/DC converter, the auxiliary power supply of multiple switching devices requires independent isolated power supplies. Taking a full-bridge converter as an example, the high-side and low-side MOSFETs (HS-FETs and LS-FETs, respectively) of the bridge arm require isolated power supplies for the gate driver circuit.

For 24 hrs of highish airco, plus your cooking use etc, I figure 22,000wh of batteries. Your AC power use, you can get by with a 2000w inverter that has a surge ability over 3000w. But I would go with a 3000w inverter. Either 24 or 48v system can support a 3000w inverter, but a 12v system would be sketchy.

Renesas" 48V Auxiliary Inverter Solution is a complete 48V motor control design using an RH850 microcontroller, power management ICs, and an inductive position sensor. It incorporates 12V/48V dual-domain concept with domain isolation, and is a proof-of-concept covering the recommendations of VDA320.
