The battery bank is actually connected to the charge controller, rather than the solar panels themselves.

How does a solar power inverter work?

In an off-grid solar system, the solar power inverter is connected to the solar battery. For grid-tied solar panels, large inverters or micro inverters may be connected directly after the charge controllers, without a storage battery. If you do not plan to use any AC electricity, then a solar inverter is entirely optional.

In a small system you might not have an inverter. Just a few DC lamps, a small refridgerator and television set or radio. These can all be connected to the switched load output of the charge controller directly and they will be disconnected when the battery Voltage is low or some other parameter that the use chooses.

If you're using a 24V battery bank and a 24V inverter, you'll want to bring your solar panel voltage up to 24V as well. This can be done either by using 24V solar panels and connecting them in parallel (since this leaves voltage alone) or by connecting sets of two 12V solar panels in series (since this will double the voltage to 24V) and ...
