Uneven electrical current distribution in a parallel-connected lithium-ion battery pack can result in different degradation rates and overcurrent issues in the cells. Understanding the electrical current dynamics can enhance configuration design and battery management of ...

To meet the power and energy requirements of the specific applications, lithium-ion battery cells often need to be connected in series to boost voltage and in parallel to add capacity [1]. However, as cell performance varies from one to another [2, 3], imbalances occur in both series and parallel connections. To prevent the imbalances from ...

Lithium battery series and parallel: There are both parallel and series combinations in the middle of the lithium battery pack, which increases the voltage and capacity. Lithium battery series voltage: 3.7 V cells can be ...

Connecting LiFePO4 batteries in series also has some drawbacks, including: Risk of Overcharging: If the cells in a series-connected battery pack have different capacities or ages, they may discharge at different rates, leading to voltage imbalances. This can result in overcharging some cells, which is dangerous and can shorten the battery pack ...
