Charging and recharging a battery wears it out, but lithium-ion batteries are also long-lasting. Today's EV batteries can be recharged at least 1,000 times and sometimes many more without losing their capacity, says Chiang. Plus, unused lithium-ion batteries lose their charge at a much slower rate than other types of batteries.

For example, at night, when no solar power is available, or when it is not windy enough for wind turbines to generate enough electricity, grid-scale batteries can provide that back-up energy source. Similarly, grid-scale batteries can help utilities deploy energy during times of generation outages to improve grid-reliability.

The future of renewable energy relies on large-scale energy storage. Megapack is a powerful battery that provides energy storage and support, helping to stabilize the grid and prevent outages. By strengthening our sustainable energy infrastructure, we can create a cleaner grid that protects our communities and the environment.
