Grid-connected and off-grid inverters

What is the main difference between grid-tied and off-grid inverters?

Grid-tied inverters are connected to the power grid and allow excess solar energy to be fed back into the grid, while off-grid inverters are not connected to the grid and require battery storage for energy use at night or on cloudy days.

How do off-grid inverters work?

Discuss your off-grid power requirements with Sunstore today! Off-grid inverters are designed to work alone and cannot synchronise with the grid. They connect to the property in place of grid power and cannot work in conjunction with it. Off grid inverters must supply power from DC to AC instantly to power the appliances.

What is a grid tied inverter?

Grid-tied inverters are designed to connect to your home to supplement mains power. When there is solar energy to use, the system will deliver it to your property. When there is insufficient energy to deliver, the system will switch back to grid power. Grid-tied inverters work with mains to provide energy wherever possible.

Can an off-grid inverter synchronise with the grid?

Off-grid inverters are designed to work alone and cannot synchronise with the grid. They connect to the property in place of grid power and cannot work in conjunction with it. Off grid inverters must supply power from DC to AC instantly to power the appliances. It must react quickly and up to and over the capacity rating of the inverter.

What are on-grid inverters?

On-grid inverters are also called grid tie inverters, which are generally divided into solar PV power generation grid tie solar inverters, wind power generation grid tie inverters, power equipment generation grid tie inverters, and other equipment generation grid tie inverters.

What is the difference between a solar inverter and an off-grid?

On-grid solar inverters are tailored for grid-connected renewable energy systems, while off-grid solar inverters, such as the 2000W off-grid solar inverter charger, cater to standalone or off-grid applications with battery storage.

Today, the vast majority of renewable energy systems -- both wind and solar electric -- are grid-connected. These systems require inverters that operate in sync with the utility grid and produce electricity that"s identical to grid power.

Off-grid solar systems require specialised off-grid inverters and battery systems large enough to store energy for 2 or more days. Hybrid grid-connected systems use lower-cost hybrid (battery) inverters and only require a battery large enough to supply energy for 5 to 10 hours (overnight), depending on the application.
