When your inverter is drawing 1200 watts, your alternator will be delivering full output. If you draw more than 1200 watts (or whatever your alternator can produce) for an extended period of time, you also run the risk of ending up with a dead battery, even though your truck was idling. Kurtwm1 noted an approach to reduce risk.

For example: If you're running a 1500W inverter on your 12v battery with 1000 watts of total AC load. So your inverter will be consuming 83 amps (amps = watts/battery volts) from the battery for which you'll need a very thick cable.
