Multi-level inverters (MLI's) breakthrough in the current industrial market for various high power and high voltage applications mold the energy needs with renewable energy resources.

The IGBT inverter is used for inverting the supply voltage from DC (Direct Current) to AC (Alternating Current). IGBT inverters have low acoustic noise due to high switching frequency. The inverter topology consists of 3 legs, each carrying two switches S1,S2, S3,S4 and S5,S6. The fourth leg carries switches S7 and S8.

inverters are being used increasingly for a wide range of applications. The high efficiency of inverters is an important goal. Especially in applications where high current and high power are required, usually silicon (Si) IGBTs are used because IGBTs have lower saturation voltage than MOSFETs at high current. However, IGBTs
