

What is a power supply protection function?

In electronic systems, the protection functions within a power supply play a critical role in maintaining overall system stability. Current and voltage protection mechanisms effectively safeguard devices from damage due to abnormal rises in current or voltage.

What is over voltage protection (OVP)?

Introduction Most AC-DC power supplies and isolated DC-DC converters will have an Over Voltage Protection (OVP) circuit, which will protect the load in the event of an internal failure. Without it, the load could be severely damaged, a fire may occur or a potentially high voltage could cause an operator to receive an electric shock.

What does over-power protection (OPP) do?

The over-power protection (OPP) kicks in when the power we pull from a PSU exceeds its maximum rated capacity. Since UVP trigger points are not covered by the ATX specification, all manufacturers of IC protection circuits are free to set their own.

What does OTP stand for in power supplies?

Over-Temperature Protection(OTP) Over-temperature protection is another essential safety feature in power supplies, designed to prevent overheating and protect both the power supply and connected equipment. Excessive temperature can lead to component failure, decreased efficiency, and even permanent damage.

Can a power supply have both OPP and OCP?

A power supply can have both Over Power Protection (OPP) and Over Current Protection (OCP) and use them concurrently.

What does OPP stand for in a power supply?

OPP stands for overpower protection(also known as overload protection - OLP) in a power supply.

OPP (Over Power Protection) Over Power Protection or OPP is a protection that will shut down the PSU when

too much power is pulled, generally this is between 110 and 140% of the advertised wattage. This is a protection that works as a limit, shutting down when a certain point is reached, but doesn't actively monitors the amount of current.

I am designing a DC buck power supply for some 5V and 12V electronics, and I was wondering about generally accepted good practices when it comes to sizing overcurrent protection. Searching around, I found a lot of information for larger and higher voltage systems, but very little for very low voltage (<50V) electronics.

When current drawn exceeds the rating of the PSU, the protection circuit will be triggered to protect the unit against overload/overcurrent. Protections of overload/overcurrent can be divided into several forms: (1)FOLDBACK ...
