

Did the Great Divide separate the Solar System?

In a study published today in Nature Astronomy,researchers from the United States and Japan unveil the possible origins of our cosmic neighborhood's "Great Divide." This well-known schism may have separated the solar systemjust after the sun first formed.

Did scientists discover a similar divide in our Solar System?

Now, scientists believe they've discoveredhow a similar divide was created in our solar system, according to a new study. Looking at our solar system, the divide seems obvious: On one side there are terrestrial planets like Earth and Mars. Then, on the other side, there are the gas giants like Jupiter and Saturn.

Did a schism separate the Solar System?

This well-known schism may have separated the solar systemjust after the sun first formed. The phenomenon is a bit like how the Rocky Mountains divide North America into east and west. On the one side are "terrestrial" planets like Earth and Mars.

How did a divide keep planets from mingling?

Then,on the other side, there are the gas giants like Jupiter and Saturn. A divide seemingly kept the material responsible for these types of planets from mixing together in the early days of the solar system, preventing outer material from mingling with the inner. But what preserved this composition?

What is the Great Divide in astronomy?

The research is published in Nature Astronomy. Shortly after the Solar System formed, astronomers think it went through what's known as the Great Divide - a splitting up of the planets into two distinct groups.
