The authors in proposed a superconducting magnetic energy storage system that can minimize both high frequency wind power fluctuation HVAC cable system's transient overvoltage. A 60 km submarine cable was modelled using ATP-EMTP in order to explore the transient issues caused by cable operation.

What is a superconducting system (SMES)?

A SMES operating as a FACT was the first superconducting application operating in a grid. In the US, the Bonneville Power Authority used a 30 MJ SMES in the 1980s to damp the low-frequency power oscillations. This SMES operated in real grid conditions during about one year, with over 1200 hours of energy transfers.

Do power converters need a superconducting magnet?

The active power transfers, which require a superconducting magnet, are a small part. So a FACTS, which provides only reactive power such as the STACOM (D-VAR) meets most of the grid requi-rements. Using PWM (Pulse Width Modulated) power converters, they do not need a super-conducting magnet.

What is a conventional energy storage system based on a battery?

A conventional energy storage system (ESS) based on a battery has been used to tackle the shortage in system inertia but has low and short-term power support during the disturbance.

Wind energy integration into power systems presents inherent unpredictability because of the intermittent nature of wind energy. The penetration rate determines how wind energy integration affects system reliability and stability [4]. According to a reliability aspect, at a fairly low penetration rate, net-load variations are equivalent to current load variations [5], and ...

The superconducting magnetic and energy storage (SMES) system is considered one of the favorable forms in the ESSs. It has gotten a lot of attention despite its high cost. Compared to the other ESSs, the SMES system can extend an enormous number of charging/discharging processes with rapid service and has the most extended lifespan [22].
