What is a redox flow battery?

Although there are many different flow battery chemistries, vanadium redox flow batteries (VRFBs) are the most widely deployed type of flow battery because of decades of research, development, and testing. VRFBs use electrolyte solutions with vanadium ions in four different oxidation states to carry charge as Figure 2 shows.

What is a redox flow battery (VRFB)?

The most promising, commonly researched and pursued RFB technology is the vanadium redox flow battery(VRFB). One main difference between redox flow batteries and more typical electrochemical batteries is the method of electrolyte storage: flow batteries store the electrolytes in external tanks away from the battery center.

Why do redox flow batteries have no cycle life limit?

The simple design nature also includes ease and possibility for modular construction. The simplicity of the redox flow battery and the reversible redox reaction along with the presence of two soluble redox couples (removing solid-state reactions) can facilitate batteries that in theory, have no cycle life limit [36,37].
