3. Improve the use value of wind power. After the energy storage device is installed in the wind power generation system, part of the excess wind power will be stored during the "valley" period, so that less electric energy will be sold to the grid at the "average price" taken care of by the national policy, and the stored electric energy will be sold during the "peak" period.

Regardless of response times and adjustment accuracy, an energy storage system (ESS) is far superior to the traditional thermal power unit. Retrofitting ESS is an effective way to address the large-scale grid connection problem of wind power as it advances wind output via energy storage equipment, thus making up for inaccuracies in wind forecasting.
